

Preface

These essays are not investment research in the narrow sense. They are an attempt to describe crypto markets as a complex adaptive system, then to ask what kind of practice and what kind of mind such a system demands.

The three essays make one argument when read in sequence.

The first essay describes the system itself, drawing on six independently developed frameworks from philosophy, complex systems theory, information theory, and political economy. The convergence of these frameworks on a consistent description of crypto markets is the empirical anchor of the project — not because any one of them is the right account, but because the structure they jointly pick out is visible enough across enough viewing angles to be taken seriously.

The second essay describes how a participant operates inside that system. The frame is Platonic: every actual market deviates from an ideal Form, and active returns are generated in the space between them. The practitioner's task is to maintain an independent model of where the Form sits, build positions whose maximum drawdown is survivable by design, and extract maximum information from every outcome. The epistemic discipline is sharper than the financial one.

The third essay asks the prior question. What is the relationship between the human mind and the structures it picks out? When six independently developed frameworks describe the same underlying object, are they triangulating something real, or producing a coherent fiction by selecting the parts that align? The case for the strong reading rests on evidence drawn from outside the markets analysis entirely — the unreasonable effectiveness of mathematics in describing physical reality, and the structure of peak aesthetic experience. The case requires the kind of cross-disciplinary thinking the project itself depends on, which is increasingly homeless within the modern research university.

Each essay can be read on its own. Together they describe a system, a practice, and a mind. The project is to ask whether the same structural account holds across all three, and what follows for the participant who recognises it.
